INSTALLATION ABOVE GROUND

CHARACTERISTICS

Monoblock platform designed by computer with the purpose of achieving maximum resistance to all type of efforts and loads. Reinforced structure to withstand loads much higher than its nominal capacity.

Versions in Steel painted with zinc epoxy primer and polyurethane enamel, with 4 cells in nickel-plated steel; Stainless steel AISI 304 versions with glass-jet finish with 4-cell stainless steel.

Built for exclusive use on the ground, this platform is supported by 4 cells that comply with IP68 protection, with a CE approval certificate mentioned in the respective datasheet.

Each cell supports in the ground by a pivoting foot, in Steel or Stainless Steel, with a kneecap system that assures a return to the initial position against all the lateral efforts. The cell connection is carried out in an aluminum mixing box, which complies with IP66, from which the connection cable for the display goes out.

Platform height adjustable from 94 to 106 mm.
